1. INTRODUCTION

1.1 Project Overview

Streamlining Ticket Assignment for Efficient Support Operations is a system developed to improve the efficiency of support services by automating the ticket assignment process. In many organizations, support requests are handled manually, where a support manager reviews each ticket and assigns it to a technician. This manual process often causes delays, incorrect assignments, and uneven workload distribution among support staff.

The proposed system automates the process using the ServiceNow platform. When a user submits a support request, the system automatically analyzes the ticket details such as category, priority, and department. Based on predefined rules, the system assigns the ticket to the appropriate support technician or support team.

This automation ensures that tickets are handled quickly and efficiently without the need for manual intervention. The system also stores all ticket information in a database, allowing administrators to track ticket progress and manage support operations effectively.

The system helps organizations improve response time, reduce manual work, and increase overall productivity. By implementing this automated ticket assignment system, support teams can focus more on resolving issues rather than spending time assigning tasks manually.

1.2 Purpose

The main purpose of this project is to simplify and improve the ticket management process in organizations. Manual ticket assignment requires time and effort, especially when the number of support requests increases. This often results in delays in resolving customer issues.

The proposed system aims to automate the process of assigning support tickets using ServiceNow workflows. When a ticket is created, the system automatically assigns it to the correct support group or technician. This ensures faster response times and better task distribution among team members.
